

Security Risk Assessment Report

Part 1: Select up to three hardening tools and methods to implement

Firewalls, IDS, IPS

Firewall: is used to filter incoming and outgoing traffics flowing to network

IDS: Intrusion Detection System is a security tools ues to scan and capture and monitor networks, it does prevent malicious attacks, it scans and report to the admin so the admin can block or prevent any malicious traffic

IPS: Intrusion Prevention System is a security tools use to scan, monitor and prevent a malicious traffics in a network, unlike IDS, IPS blocks a malicious traffic

Part 2: Explain your recommendations

Solutions:

1: Sharing of passwords should be prohibited in an organization, the use of network segment should be implemented, so each section has their unique passwords

2: The admin password to the data should be set privately and be secure with 2FA.(Two Factor Authentication).

3: Set the firewalls with rules, so it filters in and out traffic of the network.

4: Implementation of multifactor for secure harden, so attack actors can't break into the network with brute force.
